

Lesson 55 GitHub

GitHub is a **web-based Git repository hosting service**, which offers all of the distributed revision control and source code management (SCM) functionality of Git as well as adding its own features.

As we already said in the beginning of the project, every team or everyone is going to work on one part or one class in the code, but how are all the parts going to be collected ?

Github is the solution , which means you will publish your code in the workspace of the project.

Like that, we can know who wrote every line of the code, because each programmer will have his own unique account in Github.
